

$^{232}\text{Th}^{19}\text{F}^+ \cdot$ measured / adopted inputs $\cdot E_z = 100 \text{ V/cm}, B_z = 0 \text{ G}$

X $^3\Delta_1$ $\cdot$ levels correlated with J = 1-3 $\cdot$ basis J ≤ 8

Energies referenced to the per-J zero-field centroid, the same constant in all four configurations. Bars sit at true M_F ; F levels separate vertically, not sideways.
At 100 V/cm the molecule is essentially polarized: above the Omega doublet J is a correlation label, not a quantum number, and parity is the zero-field label carried along the field ramp.
